

# Currency Domino Effect

We added a new feature on the dashboard: a purple color on the price. We call it "Currency Domino Effect".

The Currency Domino Effect occurs when one or more currencies on the same group (Driver) start moving and the other currencies follow the trail.

When the first pair or pairs starts to move, the purple color on price will appear and if the movement becomes strong, the other pairs will follow.

Question: how can I use this information to become a better trader?

1. When you receive the alert, the first currencies you need to check are the ones that the price is purple. those are the first to fall on the domino effect (check the 8 Golden Rules to Enter a Trade)
2. When you have 7 or -7 on the currency strength and all 7 pairs on the same group are purple, that means the movement is stable. ex: if EUR is showing 7 on the currency strength and all 7 EUR pairs are purple you have a possible trade (check the 8 golden rules to enter a trade)
3. When you have 7 or -7 on the currency strength and not all 7 pairs on the same group are purple, it means that you need to check the ones that are purple to enter a trade (check the 8 Golden Rules to Enter a Trade)
4. When you have no alerts and the dashboard show 3, 4, 5, 6 positive or negative you can check the pairs with purple colors, they are the first pair or pairs to fall on the domino effect. (This type of approach is more advanced). This situation happens many times per week on the Asian sessions. The first pair or pairs start moving during the Asian session and the others will follow during the euro session. The same thing will happen during the euro session. Where the first pair or pairs will move during the euro session and the others will follow during the Asian session.

The Forex Divergent system added the purple color to the price to help traders to identify trades and better understand the forex market.
